

Baseline Detector Setup

Tracking: STS, TRD

Vertexing: STS

Hadron ID : TOF

Electron ID: RICH,
TRD, ECAL

γ , n: ECAL

The Challenge:

- very rare probes in Au+Au at reaction rates up to 10^7 events/sec
- ~ 1000 charged particle mult/event

ALICE - TRD

ATLAS - TRT

- type	(radiator+drift chamber + MWPC)	(radiator + straw tubes)
- π_{rej} (at 90% e efficiency)	~100-200	~100
- Maximum drift time	2 μs	40 ns
- Counting rates	~ 100 part/sec/cm ²	~ 10 ⁶ part/sec/cm ²
- Granularity (channel size)	high (~6 cm ²)	low (~20cm ²)

CBM - TRD

Counting rates ~ 10⁵ part/sec/cm²

High granularity

- π_{rej} (at 90% e efficiency) > 100

First HCRTRD - prototype

-type: radiator + MWPC

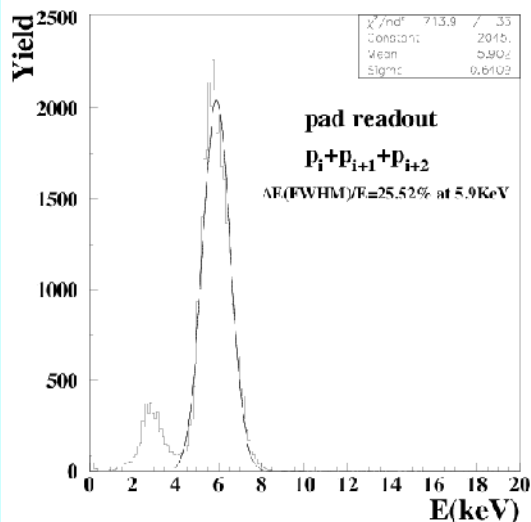

-anode-cathode distance—3 mm

-2.5 mm anode pitch

- maximum drift time ~ 100 ns

- channel size ~ 6 cm²

^{55}Fe Source Tests

NIPNE ^{55}Fe tests

30% CO_2 + 70% Ar

HV 1920 V;

Readout: PASA (2 mV/fC, 1800 e rms) + ADC Converter

Energy Resolution :

~10% (σ);

~25% FWHM

GSI ^{55}Fe tests

15% CO_2 + 85% Ar

HV 1700 V;

Readout: PASA (2mV/fC, 1800 e rms) + FADC Converter

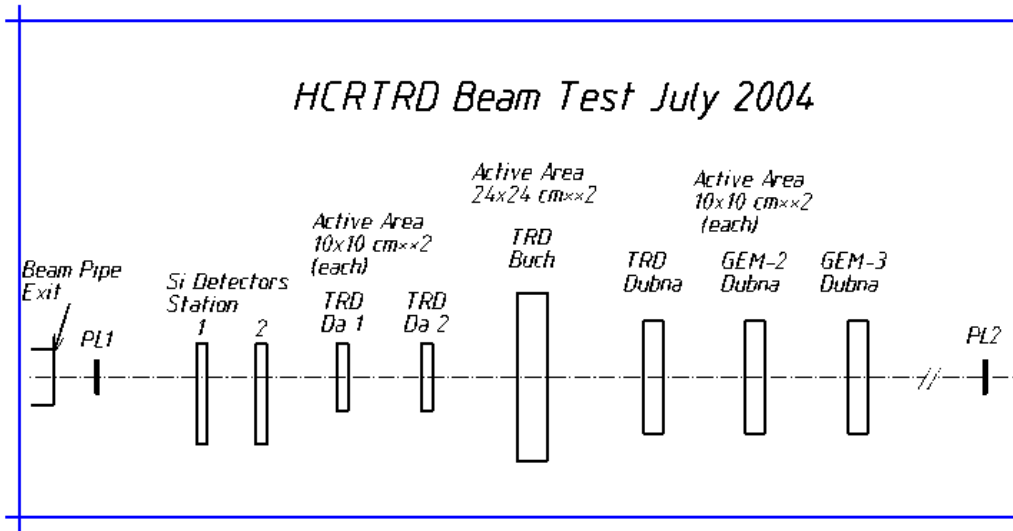

Energy Resolution:

~ 8.6 % (σ);

~20 % FWHM

In beam test, July 2004

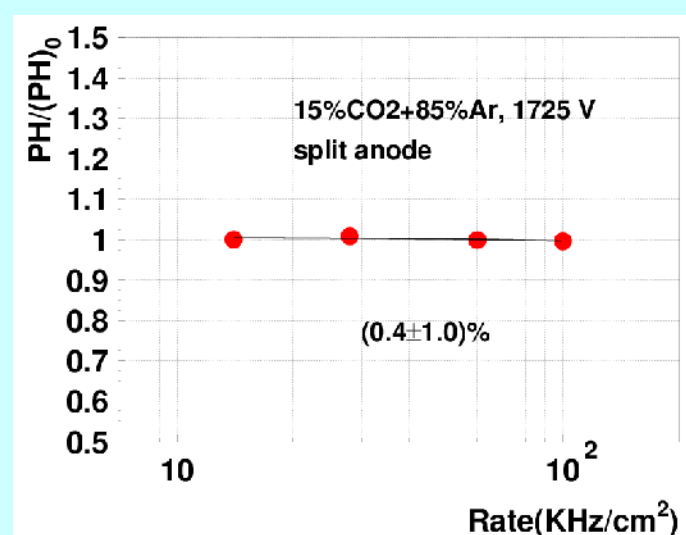

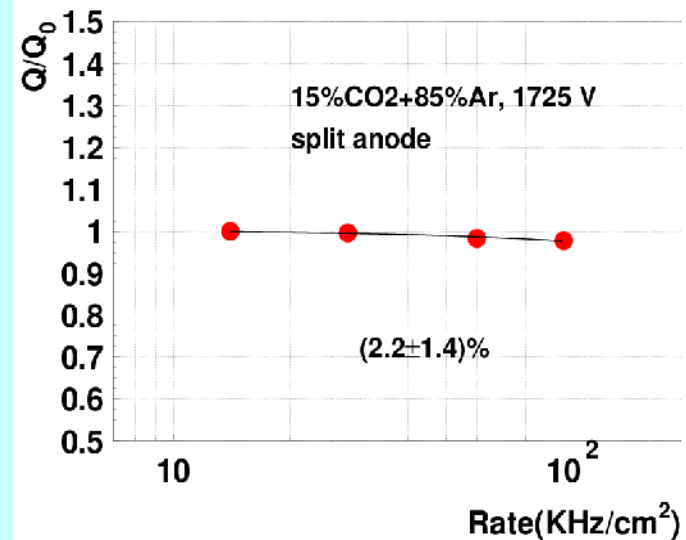

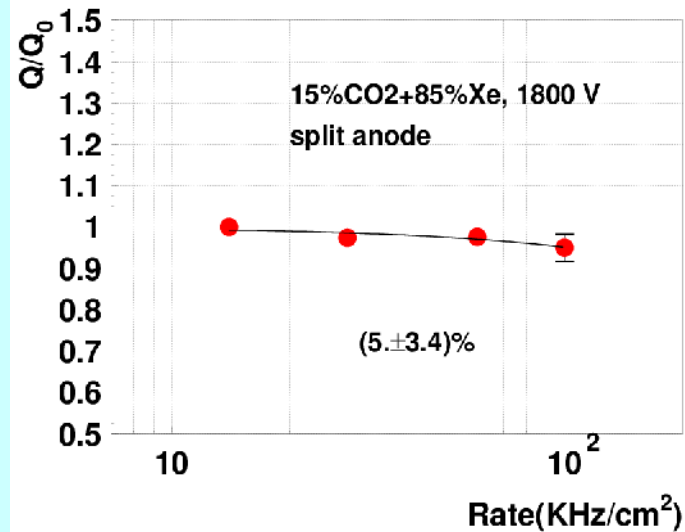

(detector performance in high counting rate environment)

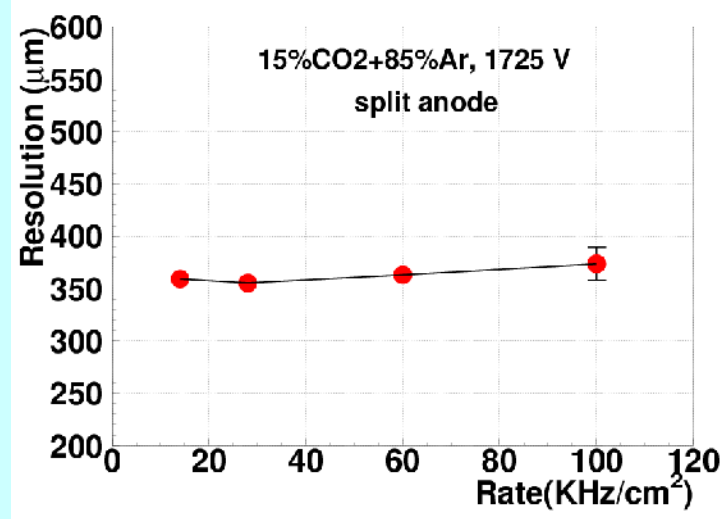

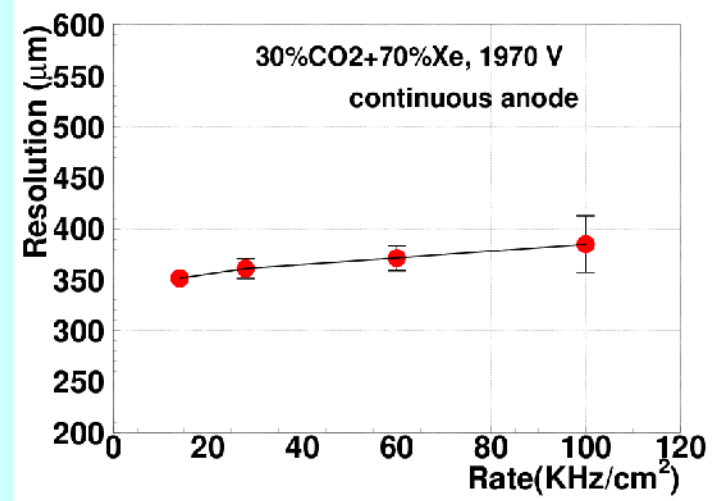

Experimental Setup:

- 2 Scintillators (ToF, trigger);
- 2 Si - Strip Detectors (position information);
- 2 MWPC - GSI ($10 \times 10 \text{ cm}^2$)
- 1 MWPC - Bucharest ($24 \times 24 \text{ cm}^2$)
- 1 MWPC - Dubna ($10 \times 10 \text{ cm}^2$)
- 1 GEM - Dubna
- Pb - glass calorimeter (last run)
- FADC readout ; DAQ (MBS)

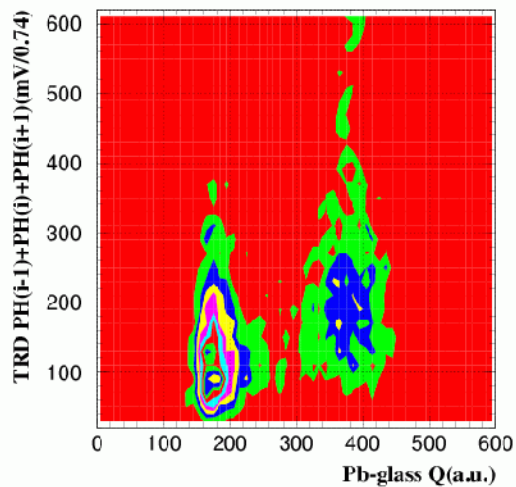

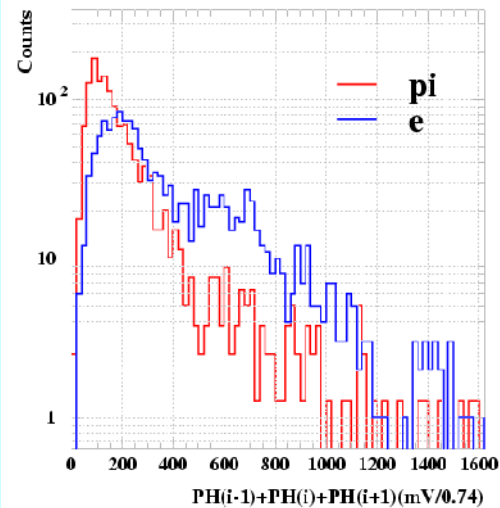

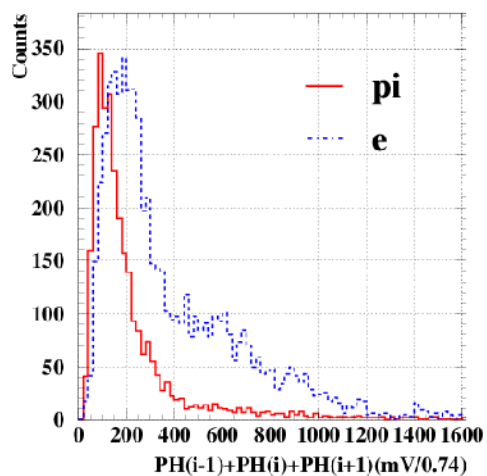

High Counting Rate Effect p -2GeV/c

High Counting Rate Effect Position Resolution ($p-2\text{GeV}/c$)

e/π Discrimination

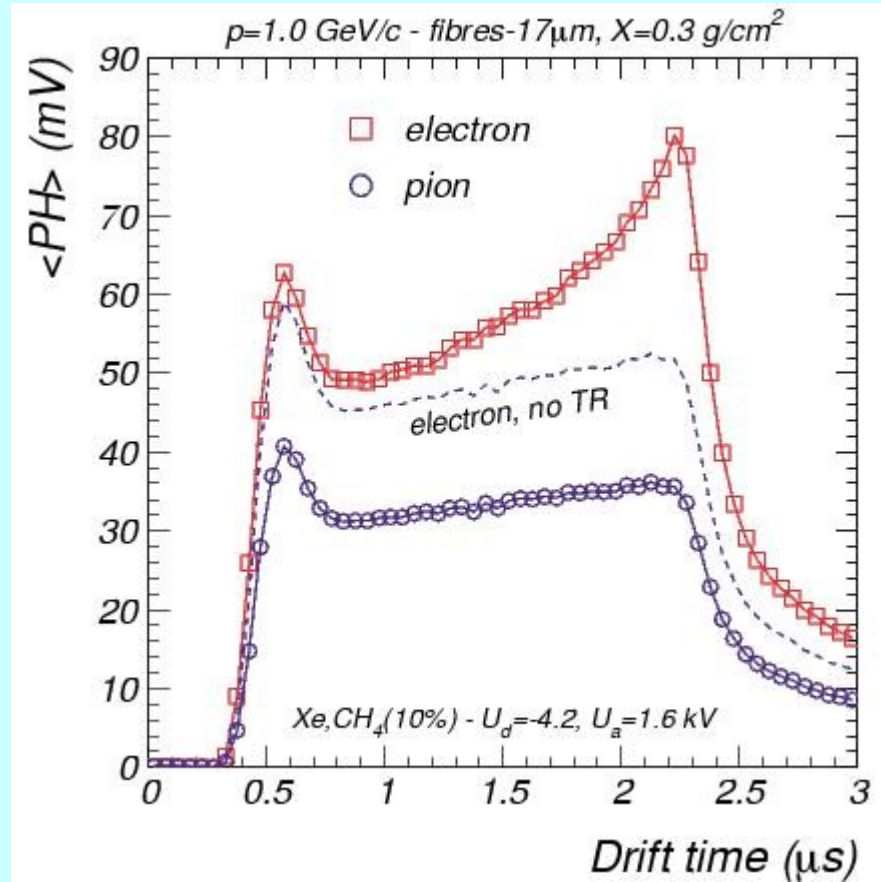

1 GeV/c

Residuals (mm)

Electron Identification

e/pi discrimination performance

Xe,CO2(15%)

1800 V

1 GeV/c

1.5 GeV/c

e/π discrimination performance 1.5 GeV/c

$\log(p_e/p_\pi)$

$p_e/(p_e + p_\pi)$

\Rightarrow 1800 V, foils, $\sim 0.7\%$ π rejection

20/500/120 \Rightarrow 20/200/220, 1.4 better

e/π discrimination performance

$Xe, CO_2(15\%)$

e/π discrimination performance ALICE - TRD

e/π discrimination – counting rate dependence

3 single cell 3 μm mylar not tested

Conclusions

- *TRD based on compact geometry MWPC works up to $> 2 \cdot 10^5$ particles/cm²/sec with negligible change of pulse height or charge ($\sim 2-3\%$)*
- *The position resolution at low rate is $\sim 160 \mu\text{m}$; the observed degradation is $\sim 20 \mu\text{m}$ at $2 \cdot 10^5$ particles/cm²/sec;*
- *A double-sided pad readout electrode brings the performance of these TRD at a π rejection factor of ~ 200 for 6 layers using appropriate foil stack radiator.*

The solution for:

- *high counting rate*
- *high granularity*
- *high e/π rejection factor*
- *minimum material budget*
- *minimum electronic channels*
